

SYNOPSIS OF GENERAL MEDICINE

General medicine is a branch of medicine that deals with the diagnosis and treatment of diseases. It is a field of health science that deals with diagnosis, nonsurgical treatment and prevention of internal diseases.

As a doctor, I will help develop my country, Zambia, using the knowledge I will acquire from my studies by helping maximize provision of health services. This will reduce diseases and number of people seeking medical services outside the country. I will also join the fight against HIV/AIDS, COVID 19 and tropical diseases such as malaria through sensitization by working with the government sector deployed to do so. Additionally, reduction of diseases will also attract many foreign investors into the country hence developing our country.

Furthermore, given a chance to study medicine in Russia would develop Zambia in that the doctor to patient ratio would reduce. Current it is at 1:12000 which is abnormal hence affecting the efficiency of doctors in the nation as the normal ratio should be 1:5000

In summation, studying medicine in Russia will go a long way in helping my country attain its objectives as I will ensure that my expertise and technical knowledge is directed towards the improvement of the health standards in the nation. The opportunity to study in Russia will expose me to best medical schools and facilities hence making a telling contribution to the health sector of our motherland, Zambia.
